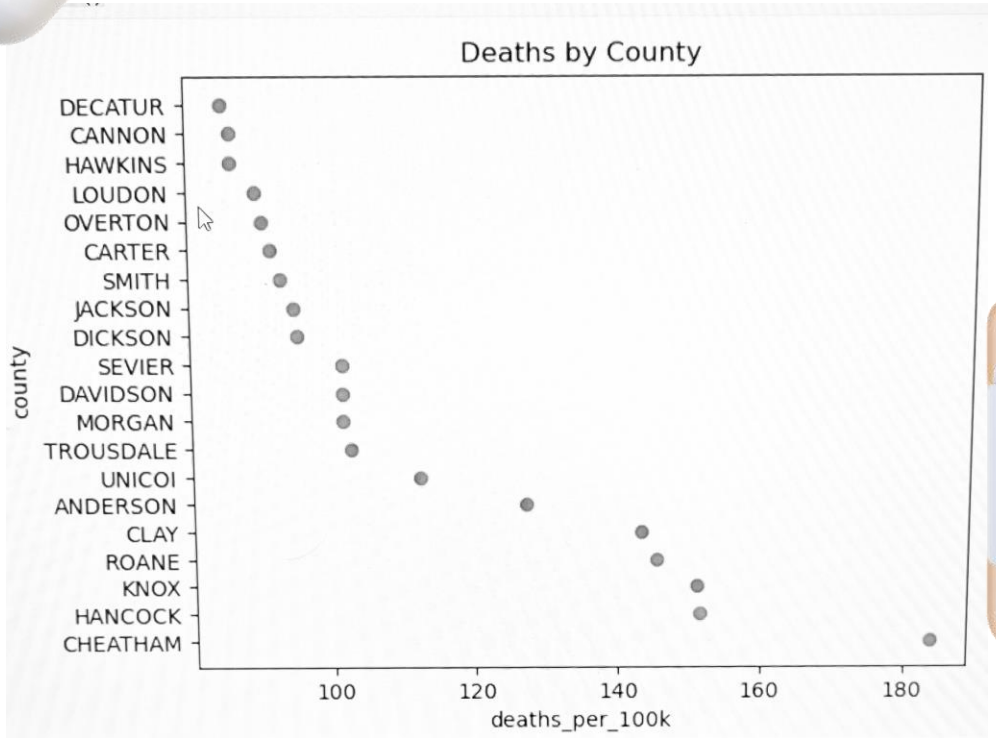
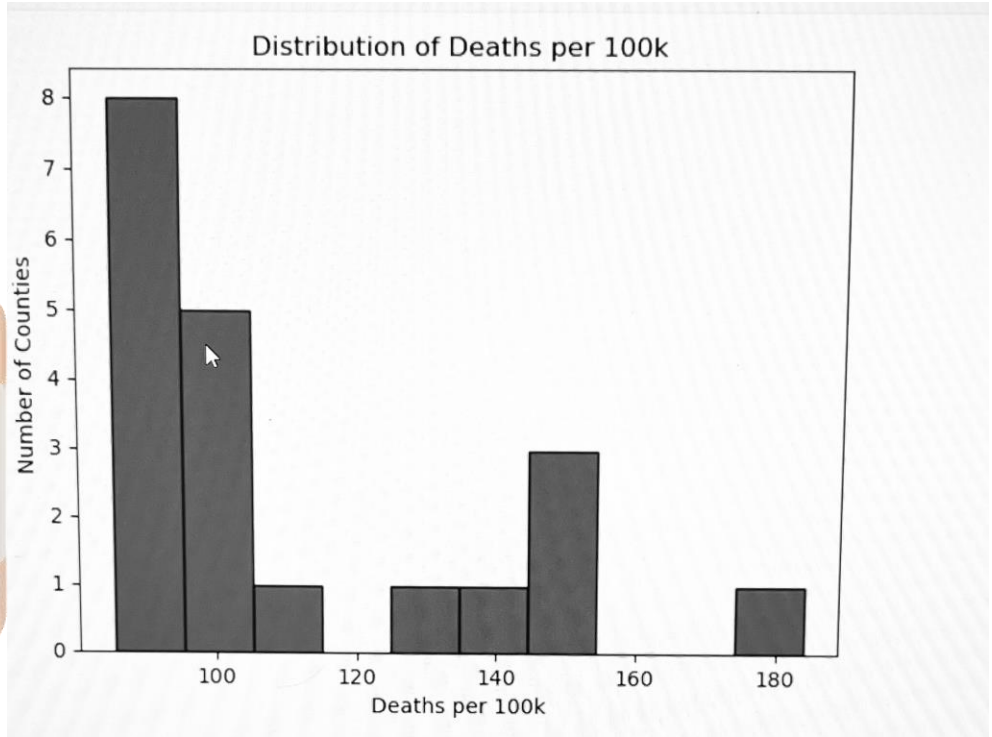
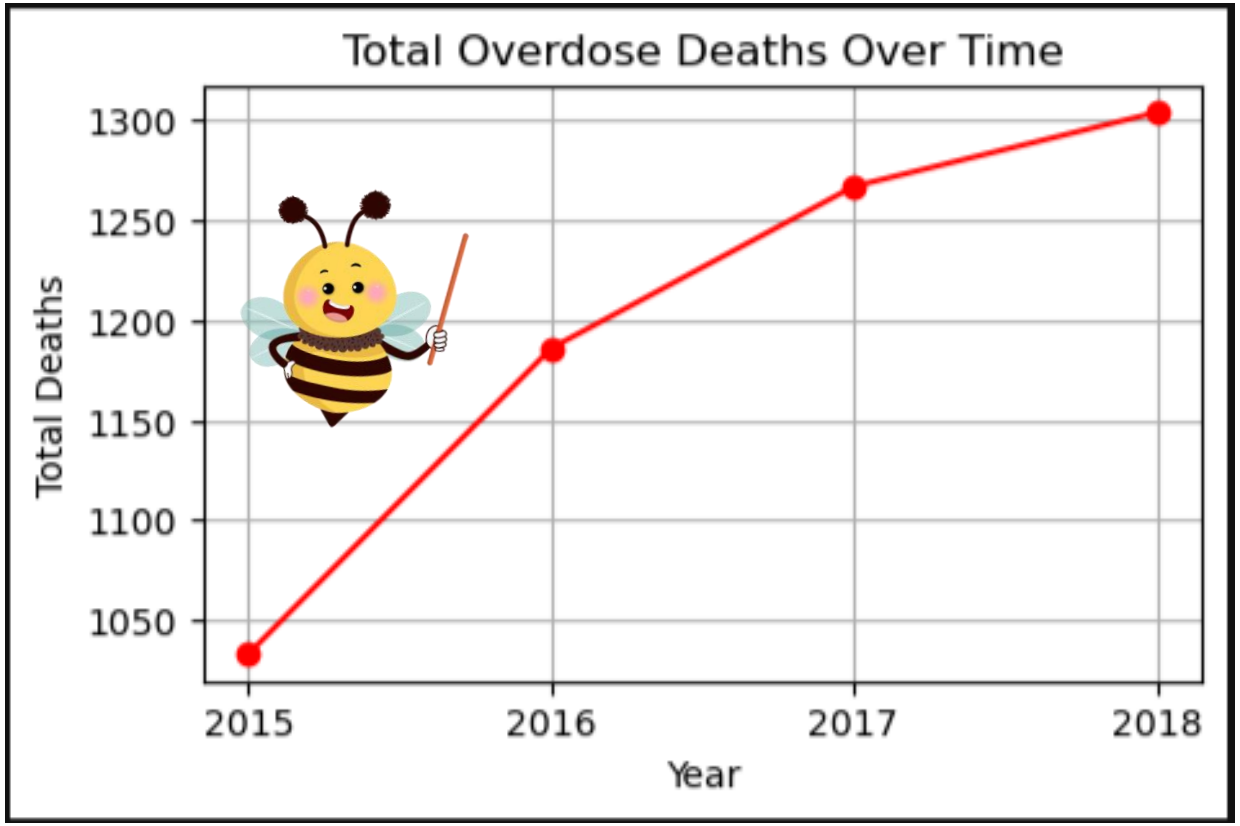
OVER DOSE DEATHS BY COUNTY



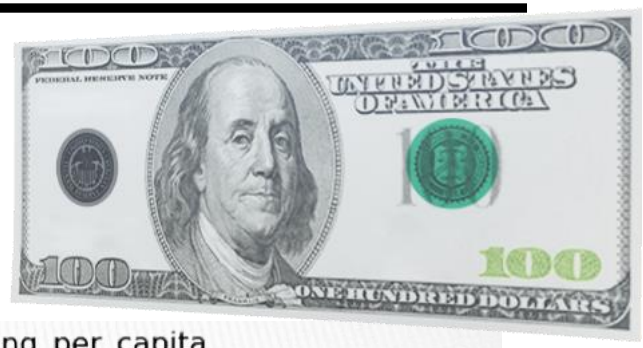


TOTAL OVERDOSE DEATHS BY YEAR

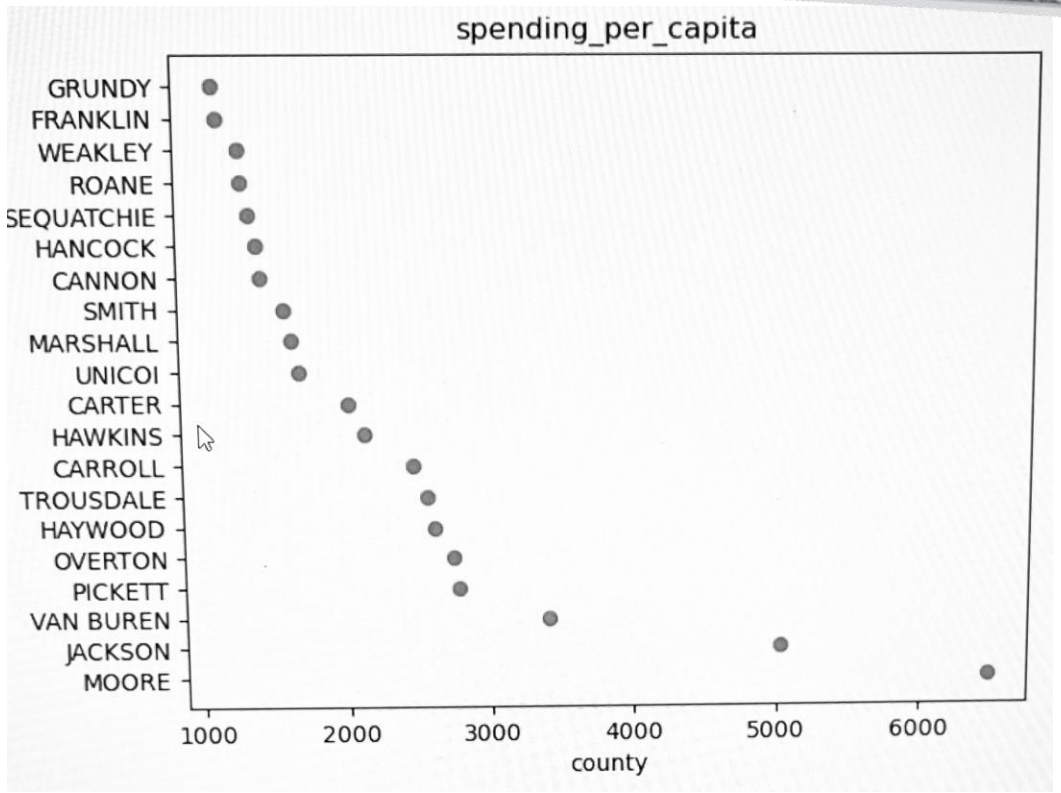
- There is a clear upward trend.
- The most significant increase happens between 2015 and 2016.
- Death rates continue to rise from 2017 and 2018 but at a slower rate.
- The highest number of deaths occurred in 2018.



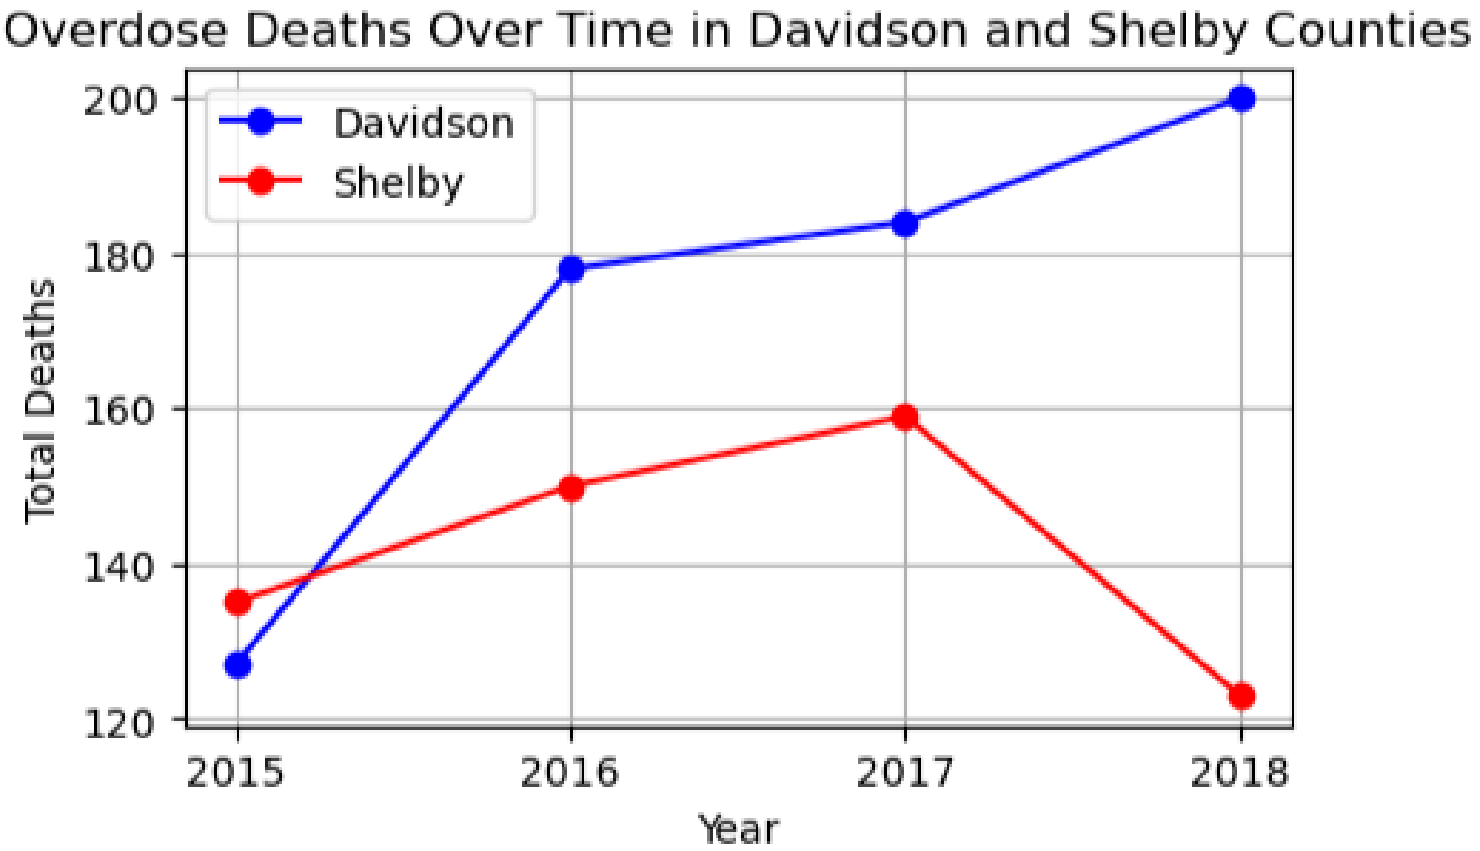
SPENDING PER CAPITA



- Each dot represents a county and how much they have spent per person.
- Most counties are clustered on the lower end of the spending.
- Theses outliers show unequal distribution or unique local factors.

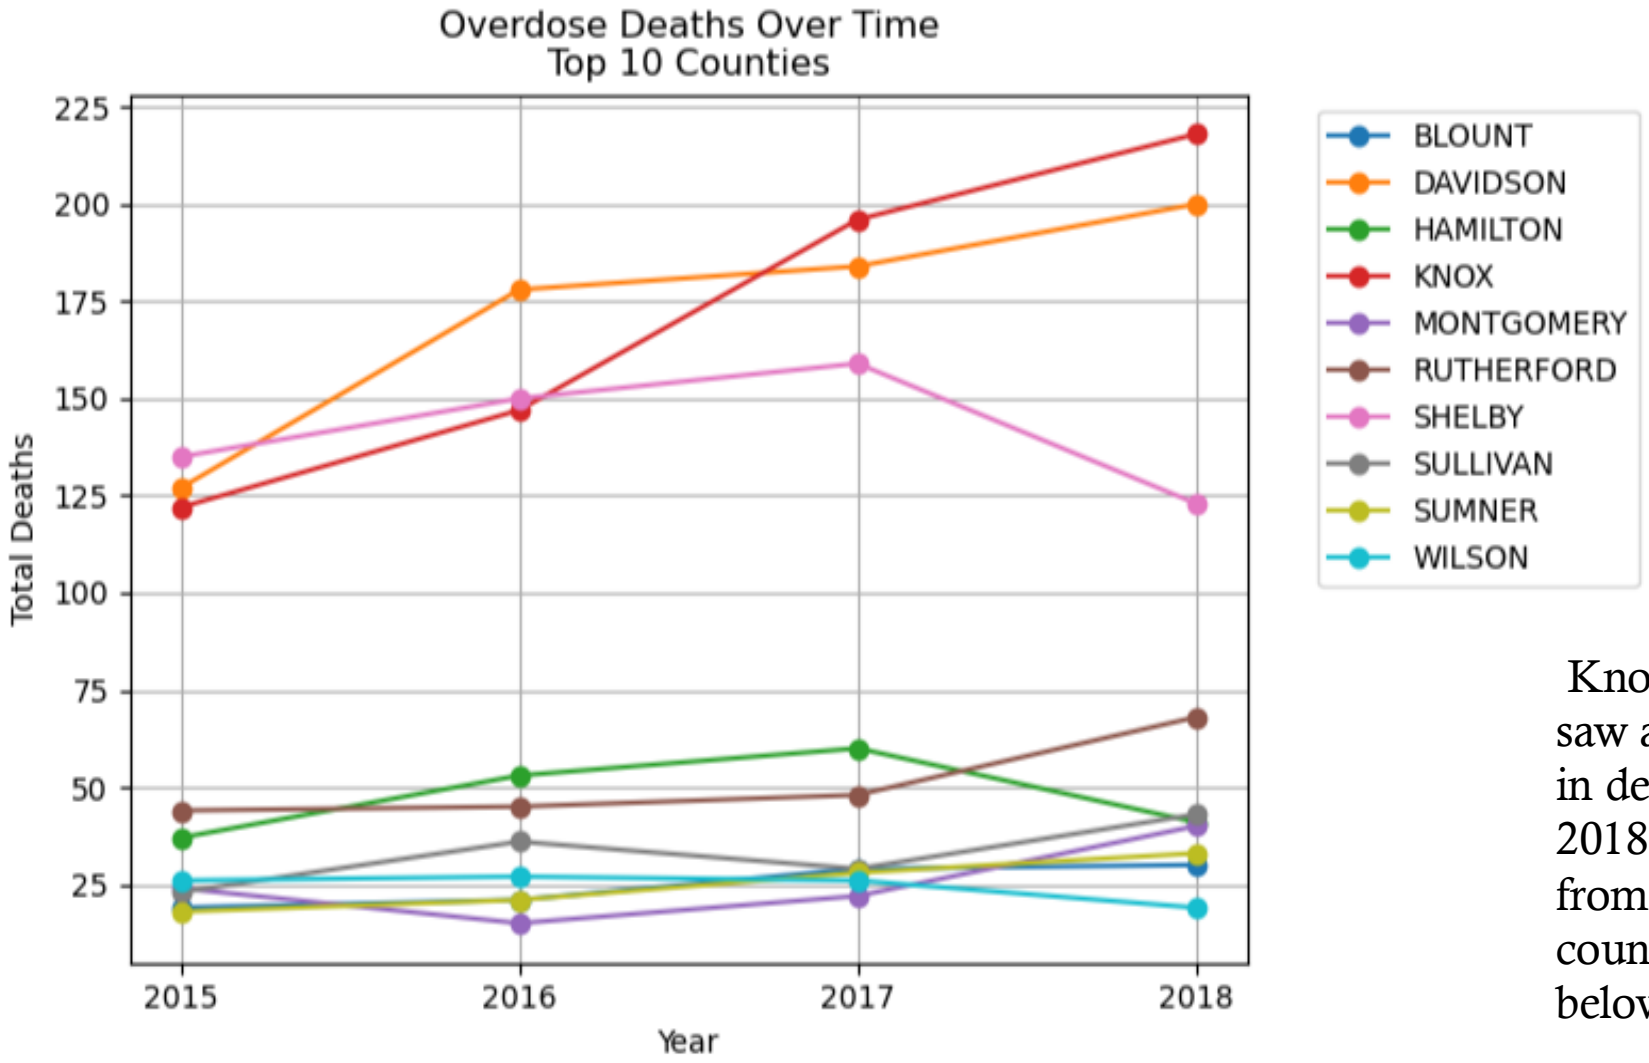


COMPARISON OF DAVIDSON AND SHELBY COUNTIES



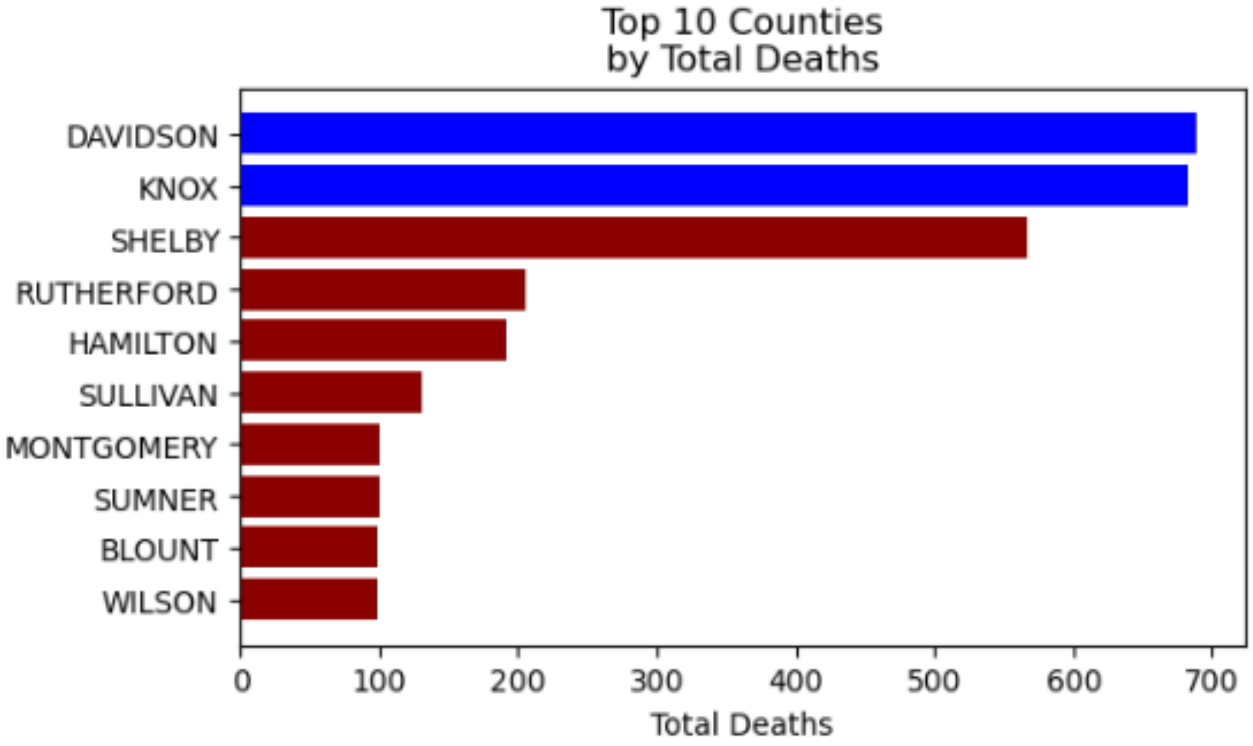
It is important to note that the Tennessee Department of Health indicated a potential undercount of 2018 overdose deaths in Shelby County, as a high number of death investigations were still pending at the time of final reporting.

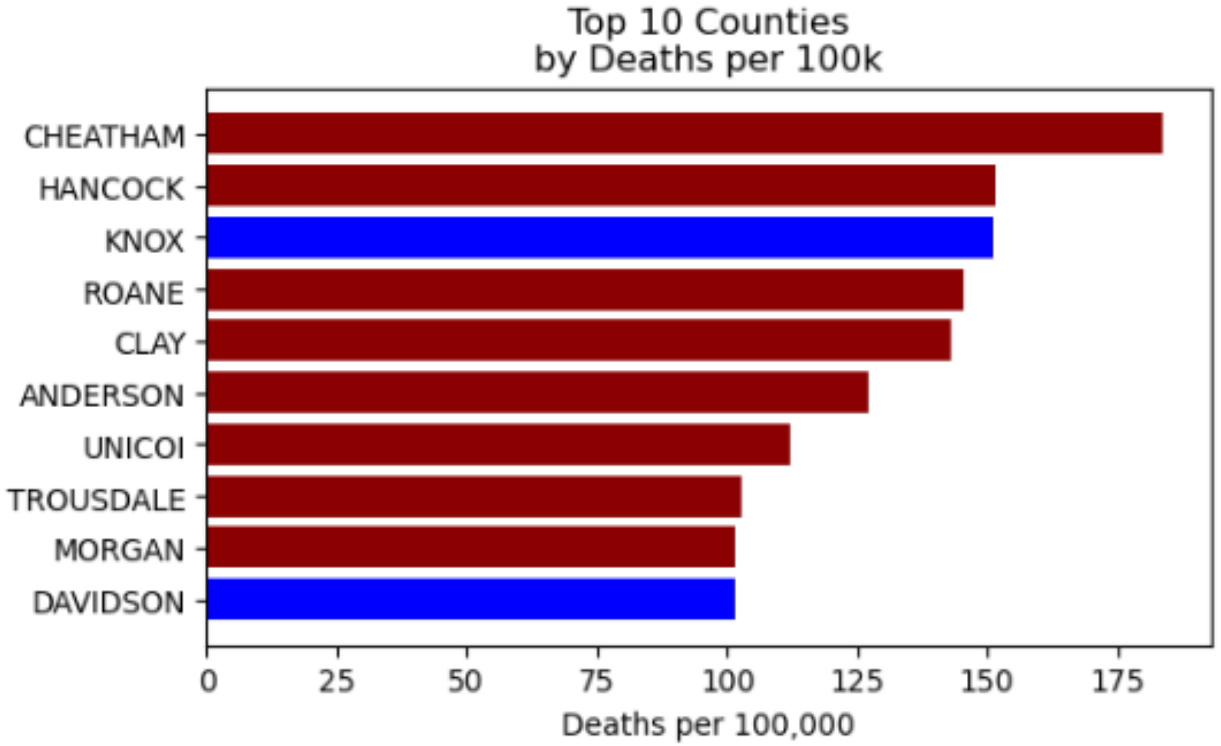
A significant backlog in autopsy and toxicology reports caused many 2018 deaths in Shelby County to be classified as "undetermined" at the time of final reporting, potentially skewing the decrease in reported fatal overdoses



Knox and Davidson Counties saw a steady and significant rise in deaths between 2015 and 2018, separating themselves from the remaining eight counties which stayed clustered below 75 deaths annually.

TOTAL DEATHS VS PER CAPITA DEATHS BY COUNTY



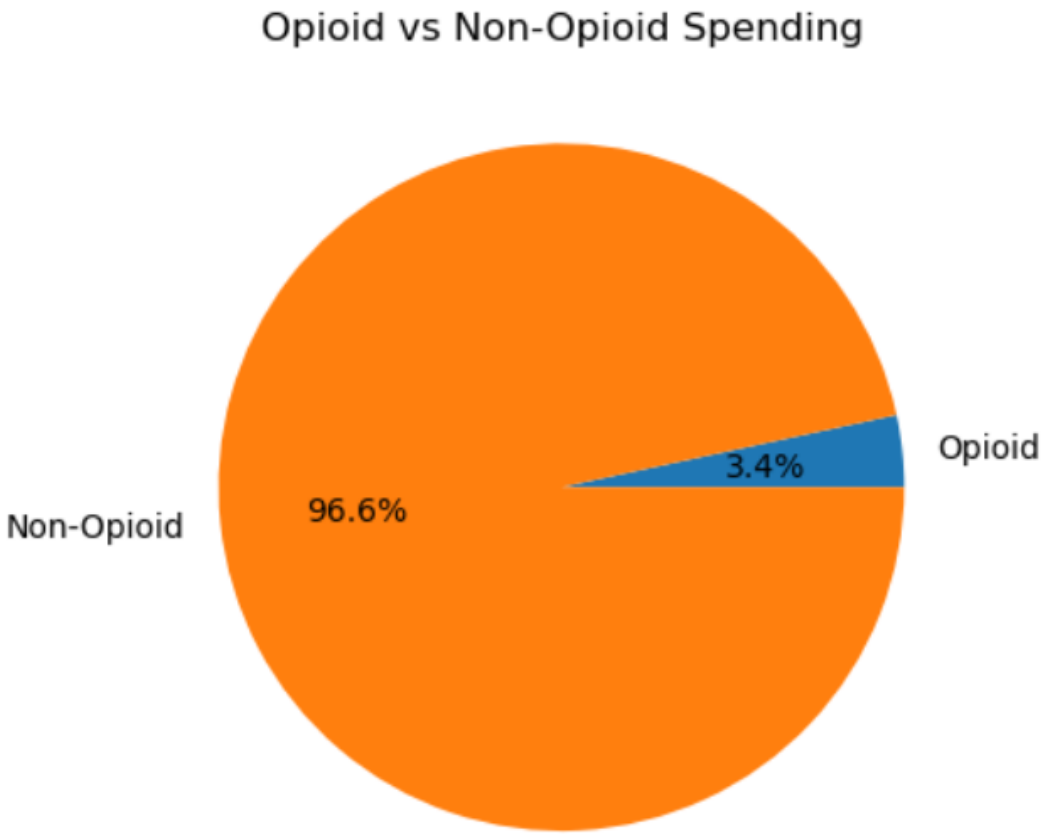


Only Knox and Davidson appear in both top 10 lists

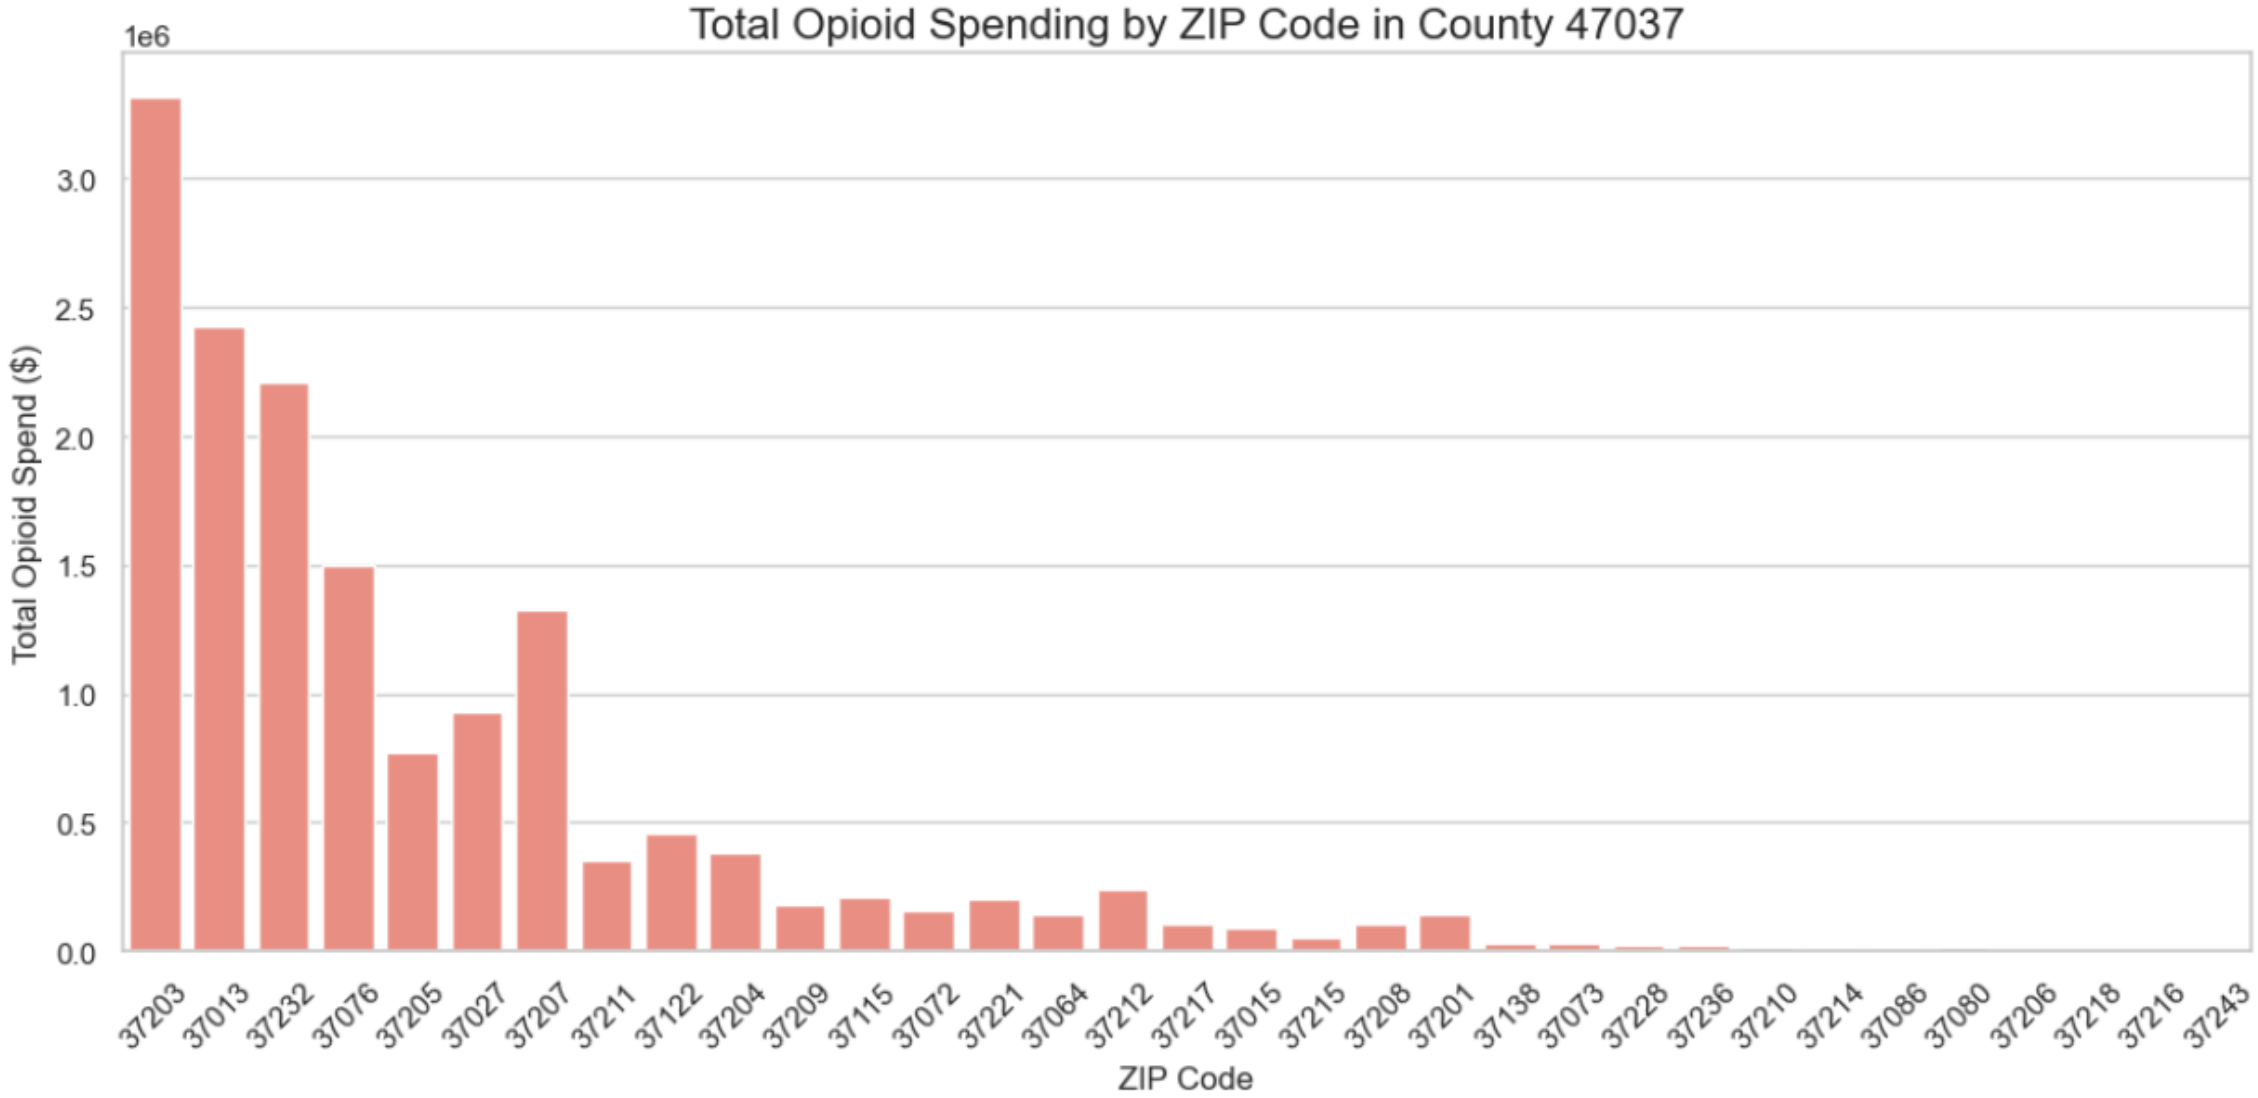
OPIOID VS. NON OPIOID

- Opioid-related deaths are **only about 3.5%** compared to non-opioid deaths

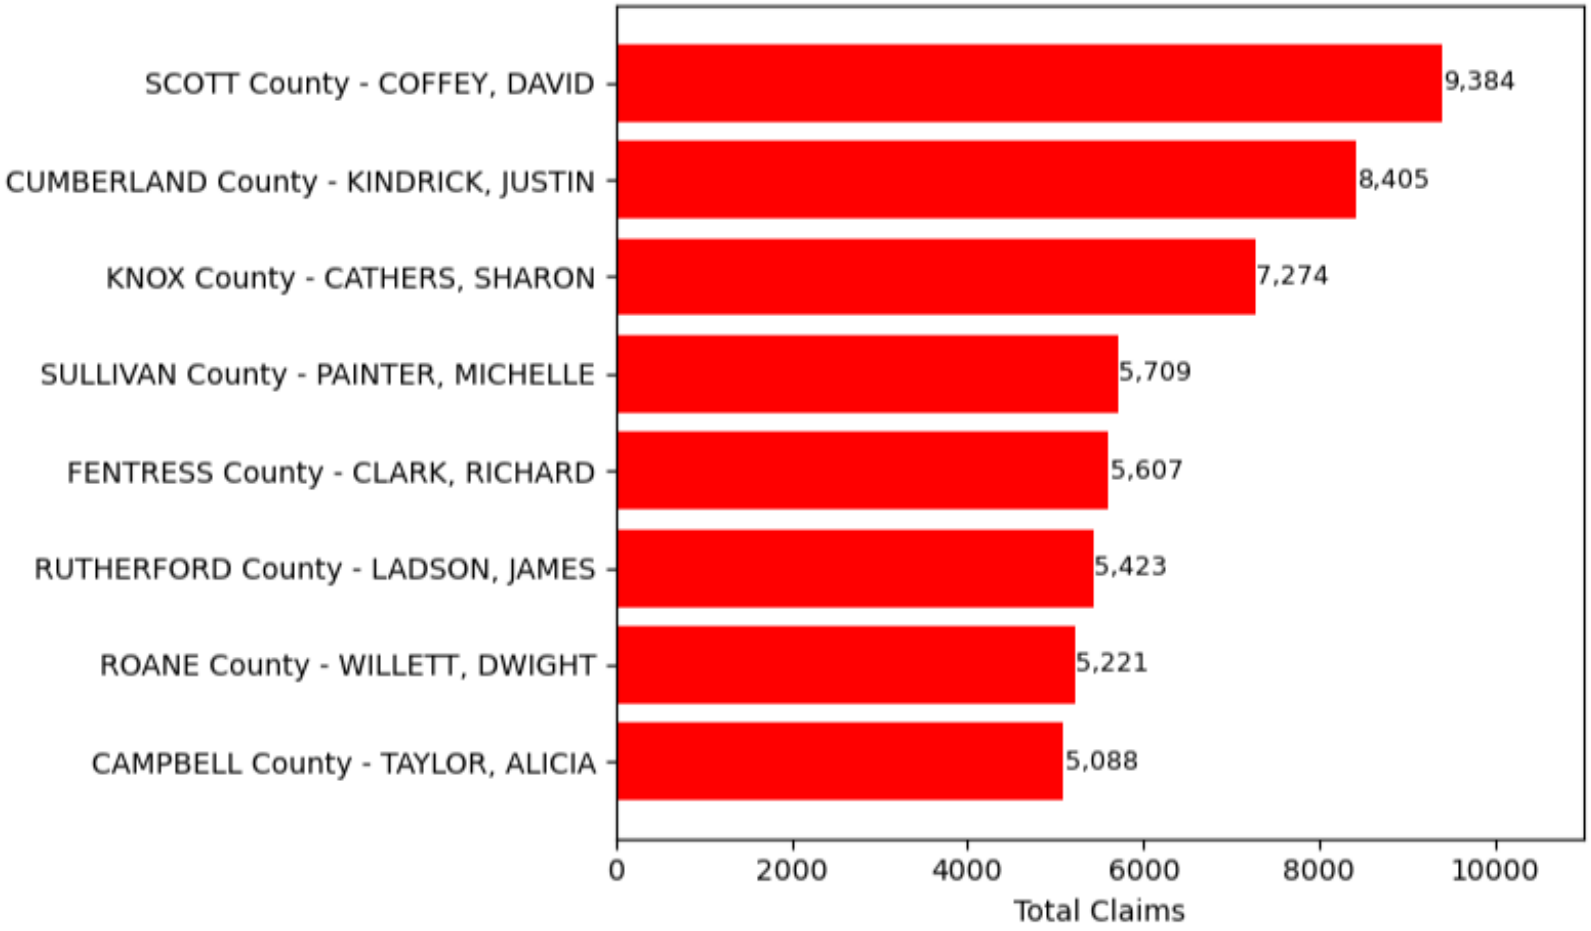
- That shows **non-opioid deaths are much higher overall** than opioid deaths.



OPIOID SPENDING BY ZIP CODE



TOP 10% OF OPIOID PRESCRIBERS BY COUNTY



CORRELATION SUMMARY

COMPARISON	CORRELATION	STRENGTH
Opioid Spending vs Deaths	0.87	Strong Positive
Opioid Ratio vs Deaths	-0.15	Very Weak Negative
Unemployment vs Deaths	-0.10	Very Weak Negative
Unemployment vs Opioid Spending	-0.17	Very Weak Negative
